

Green Seed of the Week

A weekly sustainability tip for our Q300 Community

Consider using recyclable cardboard eggs this holiday season.

Millions of children and adults enjoy egg hunts every April. But what happens to the millions of plastic eggs after the treats are found and consumed? What of the plastic grass that cradles the eggs in plastic baskets? This Spring, consider using recyclable cardboard eggs and shredded paper grass instead. Even a reusable wicker or fabric basket can become an annual egg-hunting keepsake. Bring joy to your family and our planet too!

Every year more than 300 million plastic holiday eggs are manufactured and sold. Each egg will pass through human hands for a few minutes and then spend the next 30 years breaking down and leaching toxins into our oceans and landfills. This process then causes irreparable harm to all living species across the globe.

Reduction Meter - This week's tip benefits our planet and ourselves by reducing:

 Waste  Fossil Fuel Usage  Transport Pollution  Industrial Processing

Brought to you by your fellow Q300 parents.
